CMPT 353 Final Project – Sean Bautista (spb762)

Test Report

Introduction

This report outlines the testing performed on the application. The testing is done by trying out the feature implemented on a browser. In other words, by doing manual testing by trial and error we can test each function created. Since the app is still in development, it its lacking in some other key features.

Test Cases

1) Sign-in
   a. If the username exists already, it won't let the user create an account with the same username. Otherwise, create an account and move to the log in page.
2) Log-in
   a. If the account does not exist, it won't let you go pass the log in page until you create an account with that username.
3) Create channels/post
   a. By typing the name of a post and clicking "create a channel" on the main page will create that channel (window must be reloaded so that it may show up).
4) Viewing channels
   a. Clicking a channel from the main page will go to the question/channel page.
